Word count 10,300 Suitable for younger learners Perfect for fans of And Tango Makes Three and The Sissy Duckling, this irresistible picture book is a celebration of love in all its

splendid forms from debut author J. J. Austrian and the acclaimed author-illustrator of *Little Elliot, Big City*, Mike Curato. You are cordially invited to celebrate the wedding of a worm . . . and a worm. When a worm meets a special worm and they fall in love, you know what happens next: They get married! But their friends want to know—who will wear the dress? And who will wear the tux? The answer is: It doesn't matter. Because Worm loves worm. Word count 6,000 CD: American English This monograph offers the first comprehensive treatment of the multi-faceted scholarly interests of Ole Worm, professor of medicine at the University of Copenhagen. Scholarship about Worm has focused mainly on Worm's collecting and the creation of his cabinet of curiosity, the Museum Wormianum, resulting in Worm's rationale for his research being largely overlooked. Worm shared his many interests with a number of other physicians of the age, but in terms of breadth, few matched the variety of his concerns. For a man who considered himself first and foremost a physician and anatomist, his interests in Paracelsianism and collecting can at times be baffling, while his interests in antiquarianism, runes, and chronology strike the modern reader as at odds with his medical and natural philosophical interests. It is important to comprehend that Worm's multi-faceted interests in the created world were underpinned by his Lutheran, Melanchthonian natural philosophy, and this served to unify all Worm's scholarly undertakings, inquiries, and experiments in the single aim of reaching a better understanding of God's creation, the Book of Nature. A basic overview of the life cycle of a worm. The premiere two-volume reference on revelations from studying complex microbial communities in many distinct habitats Metagenomics is an emerging field that has changed the way microbiologists study microorganisms. It involves the genomic analysis of microorganisms by extraction and cloning of DNA

from a group of microorganisms, or the direct use of the purified DNA or RNA for sequencing, which allows scientists to bypass the usual protocol of isolating and culturing individual microbial species. This method is now used in laboratories across the globe to study microorganism diversity and for isolating novel medical and industrial compounds. Handbook of Molecular Microbial Ecology is the first comprehensive two-volume reference to cover unculturable microorganisms in a large variety of habitats, which could not previously have been analyzed without metagenomic methodology. It features review articles as well as a large number of case studies, based largely on original publications and written by international experts. This second volume, Metagenomics in Different Habitats, covers such topics as: Viral genomes Metagenomics studies in a variety of habitats, including marine environments and lakes, soil, and human and animal digestive tracts Other habitats, including those involving microbiome diversity in human saliva and functional intestinal metagenomics; diversity of archaea in terrestrial hot springs; and microbial communities living at the surface of building stones Biodegradation Biocatalysts and natural products A special feature of this book is the highlighting of the databases and computer programs used in each study; they are listed along with their sites in order to facilitate the computer-assisted analysis of the vast amount of data generated by metagenomic studies. Such studies in a variety of habitats are described here, which present a large number of different system-dependent approaches in greatly differing habitats. Handbook of Molecular Microbial Ecology II is an invaluable reference for researchers in metagenomics, microbial ecology, microbiology, and environmental microbiology; those working on the Human Microbiome Project; microbial geneticists; and professionals in molecular microbiology and bioinformatics.
