**Advances in Immunology** Jan 26 2020 *Advances in Immunology*

Sequences of Proteins of Immunological Interest Aug 01 2020 A major compilation & presentation of amino & DNA sequences produced under the direction of Dr. Elvin A. Kabat, who received a National Medal of Science in 1991, for his "seminal contributions in the field of immunology". Contains new & expanded sections on T-cell reactors,  $\gamma$ 2-microglobulins, major histocompatibility antigens, complement, thymopoietin, integrins, & post-gamma globulin. Covers 9,000 sequences, plus 3 indices: index of proteins, index of antibody specificities & index of references. Best seller!!

**Band T Cell Tumors** Jul 12 2021 *B and T Cell Tumors* documents the proceedings of the 1982 International Conference on "B and T Cell Tumors: Biological and Clinical Aspects" held in Squaw Valley, California. The meeting was one of the conferences of the 1982 UCLA Symposia on Molecular and Cellular Biology series. This book is organized into six parts encompassing 79 chapters. Considerable chapters tackle the origin and classification of tumors; normal clones of T and B cells; differentiation of T and B cell tumors; regulation of tumor growth and tumor therapy. Each topic is discussed based on the results obtained in human and animal models in the laboratory. Other chapters explore lymphoid neoplasms and the enormous progress made in applying the technologies of monoclonal antibodies, cell cloning/long-term culture, and genetic analysis to questions concerning lymphoid tumors. The remaining chapters consider the malignant lymphoid cell as a model for growth and regulation, and the insights emerging from these studies, which are being applied to the development of new modalities for therapy and diagnosis. This book will be of value to scientists and clinicians who are interested in the mechanism of B and T cell tumorigenesis.

*Advances in Swine in Biomedical Research* Oct 15 2021 Contains papers from the October 1995 symposium, in sections on general aspects, transgenics, and immunology and infectious diseases. Topics include ultrastructure of the liver in piglets fed dietary oils, artificial surfactant as a vehicle for endotracheal epinephrine in pediatric porcine cardiopulmonary arrest, transplantation and genetic manipulation in porcine systems, assessment of public health aspects of porcine xenotransplantation, cellular immune responses controlling infectious diseases, and associations between stress- susceptibility and immune status in pigs. Annotation copyrighted by Book News, Inc., Portland, OR

Mechanisms of Cell-Mediated Cytotoxicity II Oct 27 2022 This book is derived from contributions to the Second International Workshop on Mechanisms in Cell-Mediated Cytotoxicity, held in Annapolis, Maryland, June 10-13, 1984. This workshop was organized by an international committee of immunologists interested in lymphocyte cytotoxic mechanisms (G. Berke, W.R. Clark, P. Golstein, M. Hanna, P. Henkart, R. Herberman, H.R. MacDonald, E. Martz, and C. Nathan), who strove to invite participants who have made major contributions to this field. The Workshop was a follow-up to the highly successful 1981 Workshop, whose proceedings Workshop were published by Plenum as Mechanisms in Cell-Mediated Cytotoxicity, edited by W.R. Clark and P. Golstein. That volume has been much appreciated by researchers and students since it contains accounts of most of the current approaches to understanding cytotoxic lymphocyte mechanisms all in one volume. The present book may be viewed as a follow-up to the first one, and in our opinion fairly summarizes the varying current viewpoints on lymphocyte cytotoxic mechanism. It should be noted that the discussions have been transcribed directly by us, and the participants have not had an opportunity to edit their remarks. We have tried to maintain some of the style of the actual discussion in these transcripts. In some cases technical problems prevented usable transcriptions from being made, and hence not all of the actual discussion at the workshop is reproduced here.

**Illustrated Dictionary of Immunology** Jul 24 2022 Resource for many of the basic terms encountered in immunological literature.

**Leucocyte Typing III** Oct 23 2019 The third international workshop on leucocyte typing antigens reports the results of collaborative experiments involving over 800 antibodies. This volume contains the first and only complete account of the experiments and the subsequent analyses, which produced a careful description of fifty human leucocyte antigens, twenty-four of them fully characterized for the first time. Antigens specific for or shared by T-Cells, B-Cells, activated lymphocytes, myeloid cells and platelets are featured. The papers detail their distribution, molecular structure and function, and discuss the role that the antigens may play in investigating and understanding pathological processes, particularly in leukemias and lymphomas.

*The Immunogenetics of Autoimmune Diseases* Jan 18 2022 Many developments in immunology have occurred over the past 10 years that give us a better understanding of the immune system and its dysfunctions. Refined mapping of the major histocompatibility complex

## Cell Surface Studies of the Hematopoietic System Jan 06 2021

*T-cell Activation in Health and Disease* Apr 21 2022 T-cell Activation in Health and Disease is a collection of papers presented at the "T-cell Activation in Health and Disease—Disorders of Immune Regulation—Infection and Autoimmunity" workshop held in Oxford on September 25-29, 1988. This book discusses the progress occurring in T-cell immunity research. One paper discusses the effects of two interaction clones of T-cells that can define the T-cell immunoregulatory network. Another paper discusses the relationship between connectivity and tolerance of the immune network. This paper then suggests the possibility that autoimmunity arises because self-reactive clones are inadequately connected to the network. Another paper reviews the cell-mediated responses in the synovial fluids, as well as the interaction of rheumatoid arthritis synovial fluid dendritic cells and T lymphocytes. The book also examines why attempts for protective immunity to the HIV virus have not been successful. One article then discusses the goals of immunologic intervention in autoimmune disease by using an approach involving the cellular and cytokine targets and their deployment. This text can prove significant for scientists in the field of pharmacology, cellular biology, and researchers in the field of immunology and infectious diseases.

**Nk Cell Mediated Cytotoxicity** Feb 19 2022 This volume provides a state-of-the-art survey of developments in the field of NK cell-cancer cell interactions, activation, and oncolytic signaling. Specific topics discussed include NK cell receptors and adhesion molecules, signal transduction and activation, and mechanisms of cytotoxicity. The book will be an excellent learning tool and reference resource for scientists, clinicians, and students.

*Autoimmunity and Autoimmune Disease* Sep 21 2019 This work focuses on the autoimmune processes that have now been proven to underlie a number of serious diseases, including diabetes mellitus, rheumatoid arthritis and multiple sclerosis. Papers explore the rapidly expanding developments in research on immune response and regulation, and their potential in the development of treatments for autoimmune diseases. The wide range of subjects covered here

include: the nature of intracellular and cell surface-derived "self" antigens; competing theories of the generation of immune tolerance and their implications of current theories for research and treatment; possible links between autoimmunity and genetic complement deficiency; the contributions of interferons and class II HLA antigen expression to autoimmunity; and the potential of monoclonal antibodies and other biotechnological advances in treating human autoimmune conditions.

**Cancer Immunology: Innovative Approaches to Therapy** Sep 26 2022 This volume is the second in the 'Cancer Treatment and Research' series focussing on basic and clinical tumor immunology. It has a rather different focus or emphasis from that of the first volume, published two years ago. That work (Basic and Clinical Tumor Immunology, R.B. Herberman, ed., Martinus Nijhoff Publishers, 1983) devoted considerable attention to up dated summaries in various areas of classical tumor immunology: specific antitumor immunity, the immunologic competence of cancer patients, characterization of human tumor-associated antigens, the ability to propagate specifically immune T cells in culture in the presence of interleukin 2, and the use of such cells for adoptive immunotherapy of established tumors. However, it also reviewed the status surveillance hypothesis and pointed out the need to consider non-T cell mediated mechanisms of host resistance. In particular, one chapter summarized information on the role of macrophages in host resistance against tumors. The present volume continues to emphasize one of the major themes of the first volume, innovative approaches to the therapy of cancer. It involves contributions from leading investigators on several primary types of therapeutic interventions related to monoclonal antibodies, the collaboration of monoclonal antibodies with macrophages to mediate antibody dependent cellular cytotoxicity, lymphokines, tumor vaccines, and natural killer cells. It also has an up-to-date summary of the immunologic aspects of the exciting and promising work being performed on human T cell leukemia virus in the laboratory of Dr. Robert Gallo.

**Molecular and Cellular Physiology of Gametes in Domestic and Wild Animal Models** Aug 25 2022

**Genetic Analysis of the Cell Surface** Dec 29 2022 The cell surface is the barrier between the cell and its environment which regulates the flow of both simple and complex molecules into and out of the cell; it is also the organelle responsible for communication between the cell and its environment. Each cell expresses receptors for a wide variety of hormones, growth factors, growth substrates and other cells. In multicellular organisms communication between cells is required for controlling development, cellular differentiation, morphogenesis and, in a more general sense, integration of myriad cell types into a single organism. The series Receptors and Recognition has as its overall aim the dissection of the cell surface to correlate structure and function for this complex organelle. In most of the preceding volumes the approach has been biochemical or physiological. In this volume the mammalian cell surface is analysed by a genetic approach. Genetic analysis of the cell surface, especially when combined with immunological techniques, has a long history. In 1900 Landsteiner showed that serum from one individual could agglutinate the red cells of another. Besides the practical result of making blood transfusion safe, this was the first demonstration of a human genetic polymorphism and for the next 50 years the red blood cell surface provided most of the genetic markers used to study human populations.

**Taurine 12** Dec 17 2021 This volume gathers a selection of original articles and reviews on timely topics about the application of Taurine in human health written by members of the International Taurine Society, including COVID-19, cancer, heart disease, and diabetes, among others. Chapters are written by Taurine experts across the globe in

North and South America, Asia, and Europe. A majority of the articles are based on original studies recently carried out in individual laboratories worldwide. The book is divided into eight parts, each covering a unique aspect of Taurine. Each section will highlight new research findings on Taurine and its application in various human systems, including the nervous system, immune system, and cardiovascular system, to combat disease. The first section covers COVID-19, the dominant health event of 2020. Experts will explore and clarify the potential therapeutic effectiveness of Taurine against COVID-19. The volume will promote further research into the application of Taurine in human health, and will be of use to a wide audience, including basic and clinical scientists, pharmaceutical and nutraceutical companies, and libraries.

*Neoplastic Hematopathology* Jun 11 2021 This updated reference has been prepared by the world's leaders in neoplastic hematopathology, a field that covers disorders of the bone marrow, spleen, and lymphatic system. This is the only comprehensive, encyclopedic text that covers the three major organ systems and integrates basic science, modern diagnostic techniques, and clinical aspects of malignant diseases affecting these organs. The Second Edition features several new contributors, more full-color illustrations, updated chapters, and three new chapters--Clinical Relevance of the Revised European/American Lymphoma Classification of Non-Hodgkin's Lymphomas; Normal Histology and Immunoarchitecture of the Lymphohematopoietic System; and Application of Molecular Genetics to the Diagnosis and Classification of Acute Leukemias. Compatibility: BlackBerry(R) OS 4.1 or Higher / iPhone/iPod Touch 2.0 or Higher / Palm OS 3.5 or higher / Palm Pre Classic / Symbian S60, 3rd edition (Nokia) / Windows Mobile(TM) Pocket PC (all versions) / Windows Mobile Smartphone / Windows 98SE/2000/ME/XP/Vista/Tablet PC

**IgE Receptor (Fc $\epsilon$ RI) Function in Mast Cells and Basophils** Oct 03 2020 The high affinity IgE receptor (Fc $\epsilon$ RI) plays a central role in allergic diseases including asthma, allergic rhinitis, atopic dermatitis, food and drug allergy. Manipulating the function of this receptor is important for controlling the onset of allergic diseases. Written by leading scientists in the field, this book is the first comprehensive monograph to cover various aspects of Fc $\epsilon$ RI structure, signal transduction and function. Thus, the book is valuable for researchers/students working on Fc $\epsilon$ RI and on other receptors. In addition, clinicians who are concerned with broadening their knowledge of the Fc $\epsilon$ RI role in

allergic diseases will find this book useful.

*The Lymphocyte* Mar 20 2022

*Proceedings of the National Academy of Sciences of the United States of America* May 10 2021

**Cell Surface and Differentiation** Nov 23 2019 Cell surface membranes contain a range of types of molecule of which proteins form a significant part, and which play important roles in regulating cellular activities, such as growth and differentiation. In recent years considerable advances have been made in the understanding of the structure and function of cell surface molecules, partly stimulated by the development of recombinant DNA technologies. This book provides a review of current knowledge of the molecular biology of the cell surface with particular emphasis on cell differentiation, relating the molecular properties of the cell surface to developmental biology. In addition to the central theme of cell differentiation, cell surface markers, which are useful in monitoring differentiation and cell adhesion molecules, which influence differentiation, are covered.

**The Chemistry of CO<sub>2</sub> and TiO<sub>2</sub>** Apr 09 2021 This book provides a comprehensive overview of the chemistry of CO<sub>2</sub> in relation to surface interactions and photocatalytic transformation by UV radiation. The first part deals with the modelling of an anatase surface, its interaction with CO<sub>2</sub>, and the spontaneous exchange of oxygen atoms between the gas and solid phases. The book then naturally transitions to the photocatalytic reduction of CO<sub>2</sub>, achieved by adding UV radiation and traces of water to the experimental system, to produce methane and CO. This photocatalytic reduction is explained in detail and the implications for planetary chemistry (specifically concerning Mars), as well as Earth's atmospheric chemistry and global warming, are discussed.

**Epidermal Langerhans Cells** May 22 2022 Epidermal Langerhans Cells focuses on epidermal Langerhans cells (LCs) and the important role they play in the induction of contact hypersensitivity and graft rejection. This in-depth work discusses how these antigen-presenting cells are modulated by various physicochemical agents (such as UV light) and how they can be infected by the AIDS virus. It also reveals that cytokines mediate their development into potent T cell-stimulatory dendritic cells. This comprehensive review covers important experimental details and methods, and fascinating information on LCs. It also provides an overview of the immune system as it relates to the

skin in health and disease. This up-to-date publication is an indispensable resource for all investigative and clinical dermatologists, as well as immunologists interested in antigen-presenting cells.

*T-Cell Dependent and Independent B-Cell Activation* Mar 08 2021 This book provides an analysis of the current subdisciplines comprising the study of humoral immune response. The first chapter presents a detailed discussion regarding the experimental and conceptual studies conducted prior to the mid-1970s that have served as a valuable research framework for investigators interested in the process by which B cells are activated following their exposure to antigens. Other chapters focus on topics such as membrane-associated proteins with important functional roles during B cell activation and differentiation; thymus-independent and thymus-dependent activation; mechanisms operative during B-T cell interactions, including the role of B cells as antigen-presenting cells; and the importance of soluble mediators. Additional topics include the regulatory role of T cells during B cell repertoire expression, memory development, tolerance, and autoimmunity. *T-Cell Dependent and Independent B-Cell Activation* is an important history and reference resource for humoral immune response investigators, as well as advanced graduate and medical students.
